Hamiltonian equations

Equilibrium Physical system: a Potential energy:

 $V(q) = rac{q^2}{2} + \lambda rac{q^4}{4} \qquad ext{where} \quad \lambda \geqslant 0.$

Hamiltonian:

$$H(q,p)=\frac{p^2}{2}+V(q).$$

Hamiltonian ODE:

$$\frac{\mathrm{d}}{\mathrm{d}t} \left(\begin{array}{c} q \\ p \end{array} \right) = \left(\begin{array}{c} \partial_p H \\ -\partial_q H \end{array} \right) \quad \Longleftrightarrow \quad \frac{\mathrm{d}^2}{\mathrm{d}t^2} q = -q - \lambda q^3.$$

Gibbs measure

Definition (Gibbs measure). We define

$$\mathrm{d}\mu(\boldsymbol{q},\boldsymbol{p}) = \mathcal{Z}^{-1} \exp\left(-H(\boldsymbol{q},\boldsymbol{p})\right) \mathrm{d}\boldsymbol{q} \mathrm{d}\boldsymbol{p}.$$

Example: If $V(q) = q^2/2 + \lambda \cdot q^4/4$, then

$$\mathrm{d}\mu(\boldsymbol{q},\boldsymbol{p}) = \mathcal{Z}^{-1} \exp\left(-\lambda \boldsymbol{q}^4/4\right) \exp\left(-\boldsymbol{q}^2/2 - \boldsymbol{p}^2/2\right) \mathrm{d}\boldsymbol{q}\mathrm{d}\boldsymbol{p}.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

 $\lambda = 0$: Gaussian measure.

 $\lambda > 0$: Absolutely continuous w.r.t. the Gaussian measure.

Teaser: This can fail in the PDE-setting.

Invariance

$$\mathrm{d}\mu(\boldsymbol{q},\boldsymbol{p}) = \mathcal{Z}^{-1} \exp \left(-H(\boldsymbol{q},\boldsymbol{p})\right) \mathrm{d}\boldsymbol{q} \mathrm{d}\boldsymbol{p}.$$

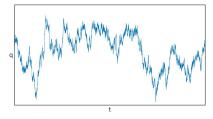

Theorem (Invariance). The Gibbs measure μ is invariant under the Hamiltonian flow.

In other words: If Law $(q(0), p(0)) = \mu$, then Law $(q(t), p(t)) = \mu$ for all $t \in \mathbb{R}$.

Proof: Conservation of energy & Liouville's theorem for divergence-free vector fields.

(Overdamped) Langevin equation

$$\mathrm{d}\boldsymbol{q} = -\boldsymbol{V}'(\boldsymbol{q})\mathrm{d}\boldsymbol{t} + \sqrt{2}\,\mathrm{d}\boldsymbol{B}$$

イロト イヨト イヨト

Theorem (Invariance). The measure

$$\mathrm{d}
u(q) = \mathcal{Z}^{-1} \exp\left(-V(q)
ight) \mathrm{d}q$$

is invariant under the Langevin dynamics.

Proof: Itô's formula.

Note: μ and ν are the "same" measure, since

$$d\mu(q, p) = d\nu(q) dGaussian(p).$$

Summary

(ロ)、(型)、(E)、(E)、 E) の(()

Equipped with the potential energy V, we can define:

- (1) A Gibbs measure.
- (2) A Langevin equation.
- (3) A Hamiltonian equation.

1. Hamiltonian and Langevin equations

2. Background and main result

Overview of the argument
 Gibbs measure
 Local theory
 Global theory and invariant

From ODEs to PDEs

Question: Can we prove the invariance of the Gibbs measure for *partial differential equations*?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Three parts:

- (1) Construction of the Gibbs measure?
- (2) Local well-posedness of the PDE?
- (3) Global well-posedness and invariance?

From ODEs to PDEs

Previously: • $q \in \mathbb{R}$. • $V(q) = \frac{q^2}{2} + \frac{q^4}{4}$. Now: • $\phi \colon \mathbb{T}_x^d \to \mathbb{K}$, where $\mathbb{K} = \mathbb{R}$ or \mathbb{C} . • $V(\phi) = \int_{\mathbb{T}_x^d} dx \left(\frac{|\phi|^2}{2} + \frac{|\nabla \phi|^2}{2} + \frac{|\phi|^4}{4}\right)$.

 Φ^4_d -models: With this potential energy, we can *formally* associate:

- (1) A Gibbs measure.
- (2) A cubic stochastic heat equation. (\leftrightarrow Langevin)
- (3) A cubic wave equation. (\leftrightarrow real-valued Hamiltonian)
- (4) A cubic Schrödinger equation. (\leftrightarrow complex-valued Hamiltonian)

Main result

The (renormalized) three-dimensional cubic nonlinear wave equation is

$$\begin{cases} (\partial_t^2 + 1 - \Delta)\phi_{\mathsf{wave}} = -\phi_{\mathsf{wave}}^3 + \infty \cdot \phi_{\mathsf{wave}} \quad (t, x) \in \mathbb{R} \times \mathbb{T}^3\\ \phi_{\mathsf{wave}}[\mathbf{0}] = (\phi_0, \phi_1). \end{cases}$$

Theorem (B.-Deng-Nahmod-Yue '22).

The cubic nonlinear wave equation is probabilistically well-posed with respect to the Gibbs measure. Furthermore, the Gibbs measure is invariant under the dynamics.

The Gibbs measure

Formal definition: Formally, Gibbs = $\Phi_3^4 \otimes$ Gaussian, where

$$\text{``d}\Phi_3^4(\phi) = \mathcal{Z}^{-1} \exp\left(-\int_{\mathbb{T}^3} \mathrm{d}x \left(\frac{|\phi|^2}{2} + \frac{|\nabla \phi|^2}{2} + \frac{|\phi|^4}{4}\right)\right) \prod_{x \in \mathbb{T}^3} \mathrm{d}\phi(x) \text{''}.$$

Rigorous treatment in [GJ73] and [BG20, GH21, MW20]: The Φ_3^4 -measure can be defined rigorously (via a finite-dimensional approximation).

Properties of samples from Φ_3^4 -measure:

- Spatial regularity $< 1 \dim_2 = -1/2$.
- Fourier coefficients are probabilistically dependent (singularity w.r.t. Gaussian free field).

Caloric representation

We construct *caloric* initial data \bigcirc , \diamondsuit , and \bigcirc , which satisfy

$$\mathsf{Law}\left(\bigcirc -\diamondsuit + \circlearrowright \right) = \Phi_3^4$$

and have the following properties:

Data	Probabilistic Structure	Regularity $<$
0	Gaussian	-1/2
\diamond	cubic Gaussian chaos	1/2
Ó	not available	1

Remark.

- We use the cubic stochastic heat equation, which has been treated in [Hai13] and [CC18, GIP15].
- This is motivated by Tao's caloric gauge [Tao04].

1. Hamiltonian and Langevin equations

2. Background and main result

Overview of the argument Gibbs measure Local theory

3.3 Global theory and invariance

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

The caloric initial value problem

$$\begin{cases} (\partial_t^2 + 1 - \Delta)\phi_{\mathsf{wave}} = -\phi_{\mathsf{wave}}^3 + \infty \cdot \phi_{\mathsf{wave}} & (t, x) \in \mathbb{R} \times \mathbb{T}^3\\ \phi_{\mathsf{wave}}[\mathbf{0}] = \mathbf{O} - \diamondsuit + \mathbf{O} \end{cases}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Why is this difficult?

Spatial regularity of O is only s = -1/2-.

Random structure

Para-controlled Ansatz:

$$\phi_{\mathsf{wave}} = \underbrace{\widehat{\mathbf{1}} - \widehat{\mathbf{Y}} - \widehat{\mathbf{1}} + 3 \widehat{\mathbf{Y}}}_{\mathsf{explicit objects}} + \underbrace{X^{(1)} + X^{(2)}}_{\mathsf{para-controlled}} + \underbrace{Y}_{\mathsf{remainder}}.$$

Overview:

Regularity	-1/2-	0-	1/2-			1/2+	
Component	Ŷ	Ŷ	Ŷ	¥	$X^{(1)}$	$X^{(2)}$	Y

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Explicit stochastic objects

Linear object:

$$(\partial_t^2 + 1 - \Delta) \, {\color{black}{\ref{planck}}} = 0, \qquad {\color{black}{\ref{planck}}} [0] = {\color{black}{O}} \, .$$

Cubic objects:

$$(\partial_t^2 + 1 - \Delta) \stackrel{\text{opp}}{=} (\stackrel{\text{opp}}{\uparrow})^3, \qquad \stackrel{\text{opp}}{=} [0] = 0.$$
$$(\partial_t^2 + 1 - \Delta) \stackrel{\text{opp}}{=} 0, \qquad \qquad \stackrel{\text{opp}}{=} [0] = \diamond.$$

Quintic object:

$$(\partial_t^2 + 1 - \Delta)$$
 $\mathfrak{P} = \mathbf{\hat{l}} \cdot \mathbf{\hat{P}} \cdot \mathbf{\hat{l}}, \qquad \mathfrak{P} [0] = 0.$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Para-controlled components and remainder

Para-controlled components:

$$\begin{split} &(\hat{\sigma}_t^2 + 1 - \Delta) X^{(1)} \simeq \big(\mathsf{High} \times \mathsf{low} \times \mathsf{low}\big) \Big(\stackrel{\mathbf{0}}{\mathbf{1}}, \, *, \, * \Big). \\ &(\hat{\sigma}_t^2 + 1 - \Delta) X^{(2)} \simeq \big(\mathsf{High} \times \mathsf{high} \times \mathsf{low}\big) \Big(\stackrel{\mathbf{0}}{\mathbf{1}}, \, \stackrel{\mathbf{0}}{\mathbf{1}}, \, * \Big). \end{split}$$

"Find all terms with regularity <1/2 and exhibit a useful structure."

Remainder:

$$(\partial_t^2 + 1 - \Delta)Y = \left\{ \text{All interactions} \right\} - \left\{ \text{Removed interactions} \right\}$$
$$\# \simeq 87 \qquad \qquad \# \simeq 6$$

"MAIN TASK"

Techniques

The article is \sim 200 pages long and combines ingredients from several different fields:

- Gaussian hypercontractivity (Probability theory)
- Lattice point estimate (Number theory/Geometry)
- Molecular graph analysis (Combinatorics)
- Multi-linear dispersive estimates (PDE)
- Multiple stochastic integrals (Probability theory)
- Para-product estimates (Harmonic analysis)
- Para-controlled calculus (SPDE)
- Random tensor estimates (Probability theory)

Personal highlight: 1533-cancellation.

Let $N \ge 1$ be a frequency-truncation parameter.

Lemma (33-divergence). The square of Ψ_{s_N} , i.e.,

$$\left(\mathbf{\Psi}_{\leq N}(t,x) \right)^2,$$

diverges as $N \rightarrow \infty$ in the sense of space-time distributions.

But, we are lucky:

Proposition (1533-cancellation). The linear combination

$$\mathbf{6} \cdot \mathbf{\hat{\gamma}}_{\leq N}(t, x) \, \mathbf{\hat{\gamma}}_{\leq N}(t, x) + \left(\mathbf{\hat{\gamma}}_{\leq N}(t, x)\right)^2$$

Global well-posedness and invariance

Goal (Invariance): If Law($\phi[0]$) = μ , then Law($\phi[t]$) = μ for all $t \in \mathbb{R}$.

Danger: Circular argument?

Solution: Bourgain!

Remark:

- The singularity of the Gibbs measure introduces severe difficulties.
- We improve on earlier works [Bri20] and [OOT21].

Thank you!
