

Motion groupoids

arXiv:2103.10377, with Paul Martin, João Faria Martins

Fiona Torzewska

University of Bristol

(I) Construction of the motion groupoid $\text{Mot}_{\underline{M}}$ of a pair $\underline{M} = (M, A)$.

Morphisms are equivalence classes of continuous flows of ambient space M which fix A , acting on $\mathcal{P}M$. Recover classical definition of the motion group associated to a manifold M and a submanifold $N \in \mathcal{P}M$, by looking at the morphism group at N . Obtain groups isomorphic to braid groups, loop braid groups.

Brief overview

(I) Construction of the motion groupoid $\text{Mot}_{\underline{M}}$ of a pair $\underline{M} = (M, A)$.

Morphisms are equivalence classes of continuous flows of ambient space M which fix A , acting on $\mathcal{P}M$. Recover classical definition of the motion group associated to a manifold M and a submanifold $N \in \mathcal{P}M$, by looking at the morphism group at N . Obtain groups isomorphic to braid groups, loop braid groups.

(II) Construction of mapping class groupoid $\text{MCG}_{\underline{M}}$.

Morphisms are now equivalence classes of homeomorphisms of M , fixing A . The object set is again $\mathcal{P}M$. Again obtain groups isomorphic to braid groups, loop braid groups.

Brief overview

(I) Construction of the motion groupoid $\text{Mot}_{\underline{M}}$ of a pair $\underline{M} = (M, A)$.

Morphisms are equivalence classes of continuous flows of ambient space M which fix A , acting on $\mathcal{P}M$. Recover classical definition of the motion group associated to a manifold M and a submanifold $N \in \mathcal{P}M$, by looking at the morphism group at N . Obtain groups isomorphic to braid groups, loop braid groups.

(II) Construction of mapping class groupoid $\text{MCG}_{\underline{M}}$.

Morphisms are now equivalence classes of homeomorphisms of M , fixing A . The object set is again $\mathcal{P}M$. Again obtain groups isomorphic to braid groups, loop braid groups.

(III) Construction of functor $F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$.

We prove that this is an isomorphism when π_0 and π_1 of space of homeomorphisms of M fixing A are trivial (with compact open topology).
E.g. $\underline{M} = ([0, 1]^n, \partial[0, 1]^n)$.

Motivation

AIM: To construct algebraic structures useful for modelling generalised particle motion in topological phases.

Motivation

AIM: To construct algebraic structures useful for modelling generalised particle motion in topological phases.

- Very general ambient space, particle types allowed.

AIM: To construct algebraic structures useful for modelling generalised particle motion in topological phases.

- Very general ambient space, particle types allowed.
- Study object sets in a unified way, questions about skeletons etc.

AIM: To construct algebraic structures useful for modelling generalised particle motion in topological phases.

- Very general ambient space, particle types allowed.
- Study object sets in a unified way, questions about skeletons etc.
- Allows access to higher categorical structures e.g. monoidal.

- Expect interesting new algebraic structures

Motion Groupoid

Space of self-homeomorphisms of a manifold M

Let **Top** denote the category of topological spaces and continuous maps.

Top(X, X) Set of continuous maps from X to X

Top ^{h} (X, X) Subset of **Top**(X, X) of self-homeomorphisms. Note this is a group.

TOP ^{h} (X, X) Set **Top** ^{h} (X, X) equipped with the compact open topology

Space of self-homeomorphisms of a manifold M

Let **Top** denote the category of topological spaces and continuous maps.

Top(X, X) Set of continuous maps from X to X

Top ^{h} (X, X) Subset of **Top**(X, X) of self-homeomorphisms. Note this is a group.

TOP ^{h} (X, X) Set **Top** ^{h} (X, X) equipped with the compact open topology

Lemma

(Hatcher) Let X be a compact space and Y a metric topological space with metric d . Then

(i) the function

$$d'(f, g) := \sup_{x \in X} d(f(x), g(x))$$

is a metric on **Top**(X, Y); and

(ii) the compact open topology on **Top**(X, Y) is the same as the one defined by the metric d' .

Space of self-homeomorphisms of a manifold M

Top _{A} ^{h} (M, M), **TOP** _{A} ^{h} (M, M) versions with subset $A \subset M$ fixed pointwise

Definition

Fix a manifold, submanifold pair $\underline{M} = (M, A)$. A **flow** in \underline{M} is a map $f \in \mathbf{Top}(\mathbb{I}, \mathbf{TOP}_A^h(M, M))$ with $f_0 = \text{id}_M$. Define,

$$\text{Flow}_{\underline{M}} = \{f \in \mathbf{Top}(\mathbb{I}, \mathbf{TOP}_A^h(M, M)) \mid f_0 = \text{id}_M\}.$$

Definition

Fix a manifold, submanifold pair $\underline{M} = (M, A)$. A **flow** in \underline{M} is a map $f \in \mathbf{Top}(\mathbb{I}, \mathbf{TOP}_A^h(M, M))$ with $f_0 = \text{id}_M$. Define,

$$\text{Flow}_{\underline{M}} = \{f \in \mathbf{Top}(\mathbb{I}, \mathbf{TOP}_A^h(M, M)) \mid f_0 = \text{id}_M\}.$$

Example

For any manifold M the path $f_t = \text{id}_M$ for all t , is a flow. We will denote this flow Id_M .

Definition

Fix a manifold, submanifold pair $\underline{M} = (M, A)$. A **flow** in \underline{M} is a map $f \in \mathbf{Top}(\mathbb{I}, \mathbf{TOP}_A^h(M, M))$ with $f_0 = \text{id}_M$. Define,

$$\text{Flow}_{\underline{M}} = \{f \in \mathbf{Top}(\mathbb{I}, \mathbf{TOP}_A^h(M, M)) \mid f_0 = \text{id}_M\}.$$

Example

For any manifold M the path $f_t = \text{id}_M$ for all t , is a flow. We will denote this flow Id_M .

Example

For $M = S^1$ (the unit circle) we may parameterise by $\theta \in \mathbb{R}/2\pi$ in the usual way. Consider the functions $\tau_\phi : S^1 \rightarrow S^1$ ($\phi \in \mathbb{R}$) given by $\theta \mapsto \theta + \phi$, and note that these are homeomorphisms. Then consider the path $f_t = \tau_{t\pi}$ ('half-twist'). This is a flow.

Example $M = D^2$

Obtaining new flows from old

Lemma

Let M be a manifold. For any flow f in $\underline{M} = (M, A)$, then $(f^{-1})_t = f_t^{-1}$ is a flow.

Obtaining new flows from old

Lemma

Let M be a manifold. For any flow f in $\underline{M} = (M, A)$, then $(f^{-1})_t = f_t^{-1}$ is a flow.

NOTE: Proof uses that $\mathbf{TOP}^h(M, M)$ is a topological group when M is locally compact and locally connected (Arens). This means the product map and inverse map are continuous.

Obtaining new flows from old

Lemma

Let M be a manifold. For any flow f in $\underline{M} = (M, A)$, then $(f^{-1})_t = f_t^{-1}$ is a flow.

NOTE: Proof uses that $\mathbf{TOP}^h(M, M)$ is a topological group when M is locally compact and locally connected (Arens). This means the product map and inverse map are continuous.

Lemma

Let M be a manifold. There exists a set map

$$\begin{aligned} \bar{\cdot} : \text{Flow}_{\underline{M}} &\rightarrow \text{Flow}_{\underline{M}} \\ f &\mapsto \bar{f} \end{aligned}$$

with

$$\bar{f}_t = f_{(1-t)} \circ f_1^{-1}. \tag{1}$$

Obtaining new flows from old

Proposition

Let M be a manifold. There exists a composition

$$\begin{aligned} * : \text{Flow}_M \times \text{Flow}_M &\rightarrow \text{Flow}_M \\ (f, g) &\mapsto g * f \end{aligned}$$

where

$$(g * f)_t = \begin{cases} f_{2t} & 0 \leq t \leq 1/2, \\ g_{2(t-1/2)} \circ f_1 & 1/2 \leq t \leq 1. \end{cases} \quad (2)$$

Obtaining new flows from old

Proposition

Let M be a manifold. There exists a composition

$$\begin{aligned} * : \text{Flow}_{\underline{M}} \times \text{Flow}_{\underline{M}} &\rightarrow \text{Flow}_{\underline{M}} \\ (f, g) &\mapsto g * f \end{aligned}$$

where

$$(g * f)_t = \begin{cases} f_{2t} & 0 \leq t \leq 1/2, \\ g_{2(t-1/2)} \circ f_1 & 1/2 \leq t \leq 1. \end{cases} \quad (2)$$

For a pair $\underline{M} = (M, A)$, $(\text{Flow}_{\underline{M}}, *)$ is a magma.

Obtaining new pre-motions from old

Proposition

Let M be a manifold. There is an associative composition

$$\begin{aligned} \cdot : \text{Flow}_{\underline{M}} \times \text{Flow}_{\underline{M}} &\rightarrow \text{Flow}_{\underline{M}} \\ (f, g) &\mapsto g \cdot f \end{aligned}$$

where $(g \cdot f)_t = g_t \circ f_t$.

Obtaining new pre-motions from old

Proposition

Let M be a manifold. There is an associative composition

$$\begin{aligned} \cdot : \text{Flow}_{\underline{M}} \times \text{Flow}_{\underline{M}} &\rightarrow \text{Flow}_{\underline{M}} \\ (f, g) &\mapsto g \cdot f \end{aligned}$$

where $(g \cdot f)_t = g_t \circ f_t$.

NOTE: Again proof uses that $\mathbf{TOP}^h(M, M)$ is a topological group.

Obtaining new pre-motions from old

Proposition

Let M be a manifold. There is an associative composition

$$\begin{aligned} \cdot : \text{Flow}_{\underline{M}} \times \text{Flow}_{\underline{M}} &\rightarrow \text{Flow}_{\underline{M}} \\ (f, g) &\mapsto g \cdot f \end{aligned}$$

where $(g \cdot f)_t = g_t \circ f_t$.

NOTE: Again proof uses that $\mathbf{TOP}^h(M, M)$ is a topological group.

Lemma

For a manifold M , $(\text{Flow}_{\underline{M}}, \cdot)$ is a group, with identity Id_M and inverse map $(f^{-1})_t = (f_t)^{-1}$.

Obtaining new pre-motions from old

Proposition

Let M be a manifold. There is an associative composition

$$\begin{aligned} \cdot : \text{Flow}_{\underline{M}} \times \text{Flow}_{\underline{M}} &\rightarrow \text{Flow}_{\underline{M}} \\ (f, g) &\mapsto g \cdot f \end{aligned}$$

where $(g \cdot f)_t = g_t \circ f_t$.

NOTE: Again proof uses that $\mathbf{TOP}^h(M, M)$ is a topological group.

Lemma

For a manifold M , $(\text{Flow}_{\underline{M}}, \cdot)$ is a group, with identity Id_M and inverse map $(f^{-1})_t = (f_t)^{-1}$.

Lemma

For $f, g \in \text{Flow}_{\underline{M}}$, $f^{-1} \stackrel{p}{\sim} \bar{f}$ and $g \cdot f \stackrel{p}{\sim} g * f$.

Definition

Fix a $\underline{M} = (M, A)$. A **motion** in M is a triple $(f, N, f_1(N))$ consisting of a flow $f \in \text{Flow}_{\underline{M}}$, a subset $N \subseteq M$ and the image of N at the endpoint of f , $f_1(N)$.

Definition

Fix a $\underline{M} = (M, A)$. A **motion** in M is a triple $(f, N, f_1(N))$ consisting of a flow $f \in \text{Flow}_{\underline{M}}$, a subset $N \subseteq M$ and the image of N at the endpoint of f , $f_1(N)$.

We will denote such a triple by $f: N \curvearrowright N'$ where $f_1(N) = N'$, and say it is a motion from N to N' .

Definition

Fix a $\underline{M} = (M, A)$. A **motion** in M is a triple $(f, N, f_1(N))$ consisting of a flow $f \in \text{Flow}_{\underline{M}}$, a subset $N \subseteq M$ and the image of N at the endpoint of f , $f_1(N)$.

We will denote such a triple by $f: N \curvearrowright N'$ where $f_1(N) = N'$, and say it is a motion from N to N' .

$$Mt_M(N, N') = \{\text{motions } f: N \curvearrowright N'\}$$

Motions

For any $N \subset M$, $Id_M: N \curvearrowright N$ is a motion. Let $f: N \curvearrowright N'$ and $g: N' \curvearrowright N''$ be motions in M , then $g \cdot f: N \curvearrowright N''$ ($(g \cdot f)_t = g_t \circ f_t$) is a motion.

For any $N \subset M$, $Id_M: N \curvearrowright N$ is a motion. Let $f: N \curvearrowright N'$ and $g: N' \curvearrowright N''$ be motions in M , then $g \cdot f: N \curvearrowright N''$ ($(g \cdot f)_t = g_t \circ f_t$) is a motion.

Lemma

There is a group action of $(\text{Flow}_{\underline{M}}, \cdot)$ on $\mathcal{P}M$, thus there is an action groupoid

$$\text{Mt}_{\underline{M}} = (\mathcal{P}M, \text{Mt}_{\underline{M}}(N, N'), \cdot, \text{Id}_M, f^{-1}).$$

For any $N \subset M$, $Id_M: N \curvearrowright N$ is a motion. Let $f: N \curvearrowright N'$ and $g: N' \curvearrowright N''$ be motions in M , then $g \cdot f: N \curvearrowright N''$ ($(g \cdot f)_t = g_t \circ f_t$) is a motion.

Lemma

There is a group action of $(\text{Flow}_{\underline{M}}, \cdot)$ on $\mathcal{P}M$, thus there is an action groupoid

$$\text{Mt}_{\underline{M}} = (\mathcal{P}M, \text{Mt}_{\underline{M}}(N, N'), \cdot, \text{Id}_M, f^{-1}).$$

Similarly $g * f: N \curvearrowright N''$ is a motion.

For any $N \subset M$, $Id_M: N \curvearrowright N$ is a motion. Let $f: N \curvearrowright N'$ and $g: N' \curvearrowright N''$ be motions in M , then $g \cdot f: N \curvearrowright N''$ ($(g \cdot f)_t = g_t \circ f_t$) is a motion.

Lemma

There is a group action of $(\text{Flow}_{\underline{M}}, \cdot)$ on $\mathcal{P}M$, thus there is an action groupoid

$$\text{Mt}_{\underline{M}} = (\mathcal{P}M, \text{Mt}_{\underline{M}}(N, N'), \cdot, \text{Id}_M, f^{-1}).$$

Similarly $g * f: N \curvearrowright N''$ is a motion.

Lemma

There is a magma action of $(\text{Flow}_{\underline{M}}, *)$ on $\mathcal{P}M$ we obtain an action magmoid

$$\text{Mt}_{\underline{M}}^* = (\mathcal{P}M, \text{Mt}_{\underline{M}}(N, N'), *).$$

Motions as maps $M \times \mathbb{I} \rightarrow M \times \mathbb{I}$

Definition

Let $\underline{M} = (M, A)$ be a manifold and $N, N' \subset M$. Let

$$\text{Mt}_{\underline{M}}^{\text{hom}}(N, N') \subset \mathbf{Top}_{A \times \mathbb{I}}^h(M \times \mathbb{I}, M \times \mathbb{I})$$

denote the subset of homeomorphisms $g \in \mathbf{Top}_{A \times \mathbb{I}}^h(M \times \mathbb{I}, M \times \mathbb{I})$ such that

- (I) $g(m, 0) = (m, 0)$ for all $m \in M$,
- (II) $g(M \times \{t\}) = M \times \{t\}$ for all $t \in \mathbb{I}$, and
- (III) $g(N \times \{1\}) = N' \times \{1\}$.

Motions as maps $M \times \mathbb{I} \rightarrow M \times \mathbb{I}$

Definition

Let $\underline{M} = (M, A)$ be a manifold and $N, N' \subset M$. Let

$$\text{Mt}_{\underline{M}}^{\text{hom}}(N, N') \subset \mathbf{Top}_{A \times \mathbb{I}}^h(M \times \mathbb{I}, M \times \mathbb{I})$$

denote the subset of homeomorphisms $g \in \mathbf{Top}_{A \times \mathbb{I}}^h(M \times \mathbb{I}, M \times \mathbb{I})$ such that

- (I) $g(m, 0) = (m, 0)$ for all $m \in M$,
- (II) $g(M \times \{t\}) = M \times \{t\}$ for all $t \in \mathbb{I}$, and
- (III) $g(N \times \{1\}) = N' \times \{1\}$.

Theorem (T., Faria Martins, Martin)

Let M be a manifold and $N, N' \subset M$. There is a bijection

$$\begin{aligned} \Theta: \text{Mt}_{\underline{M}}(N, N') &\rightarrow \text{Mt}_{\underline{M}}^{\text{hom}}(N, N'), \\ f &\mapsto ((m, t) \mapsto (f_t(m), t)). \end{aligned}$$

Theorem (T., Faria Martins, Martin)

Let M be a manifold and $N, N' \subseteq M$. There is a bijection

$$\begin{aligned} \Theta: \text{Mt}_{\underline{M}}(N, N') &\rightarrow \text{Mt}_{\underline{M}}^{\text{hom}}(N, N'), \\ f &\mapsto ((m, t) \mapsto (f_t(m), t)). \end{aligned}$$

Theorem (T., Faria Martins, Martin)

Let M be a manifold and $N, N' \subseteq M$. There is a bijection

$$\begin{aligned}\Theta: \text{Mt}_{\underline{M}}(N, N') &\rightarrow \text{Mt}_{\underline{M}}^{\text{hom}}(N, N'), \\ f &\mapsto ((m, t) \mapsto (f_t(m), t)).\end{aligned}$$

Idea of proof

(e.g. Hatcher) As M is locally compact, Hausdorff, there is a bijection

$$\Phi: \mathbf{Top}(\mathbb{I}, \mathbf{TOP}(M, M)) \rightarrow \mathbf{Top}(M \times \mathbb{I}, M).$$

(Coming from an adjunction between the product functor $M \times -$ and the hom functor $\mathbf{TOP}(M, -)$). It follows that the image is continuous. To show that the image is a homeomorphism we need that $\mathbf{TOP}^h(M, M)$ is a topological group.

$$M = \mathbb{I}$$

→

$$M = \mathbb{I}$$

$$M = S^1$$

* composition when $M = \mathbb{I}$

Congruence by set-stationary motions

Definition

Let $\underline{M} = (M, A)$ be a manifold, subset pair and $N \subset M$ a subset. A motion $f: N \curvearrowright N$ in \underline{M} is said to be N -stationary if $f_t(N) = N$ for all $t \in \mathbb{I}$. Define

$$\text{SetStat}_{\underline{M}}^N = \{f: N \curvearrowright N \in \text{Mt}_{\underline{M}}(N, N) \mid f_t(N) = N \text{ for all } t \in \mathbb{I}\}.$$

Congruence by set-stationary motions

Definition

Let $\underline{M} = (M, A)$ be a manifold, subset pair and $N \subset M$ a subset. A motion $f: N \curvearrowright N$ in \underline{M} is said to be N -stationary if $f_t(N) = N$ for all $t \in \mathbb{I}$. Define

$$\text{SetStat}_{\underline{M}}^N = \{f: N \curvearrowright N \in \text{Mt}_{\underline{M}}(N, N) \mid f_t(N) = N \text{ for all } t \in \mathbb{I}\}.$$

Example

Let $M = D^2$ and let $\tau_{2\pi}$ denote a flow such that $(\tau_{2\pi})_t$ is a $2\pi t$ rotation of the disk. Now let N be a circle centred on the centre of the disk. Then $\tau_{2\pi}: N \curvearrowright N$ is N -stationary.

Congruence by set-stationary motions

Definition

Let $\underline{M} = (M, A)$ be a manifold, subset pair and $N \subset M$ a subset. A motion $f: N \curvearrowright N$ in \underline{M} is said to be N -stationary if $f_t(N) = N$ for all $t \in \mathbb{I}$. Define

$$\text{SetStat}_{\underline{M}}^N = \{f: N \curvearrowright N \in \text{Mt}_{\underline{M}}(N, N) \mid f_t(N) = N \text{ for all } t \in \mathbb{I}\}.$$

Example

Let $M = D^2$ and let $\tau_{2\pi}$ denote a flow such that $(\tau_{2\pi})_t$ is a $2\pi t$ rotation of the disk. Now let N be a circle centred on the centre of the disk. Then $\tau_{2\pi}: N \curvearrowright N$ is N -stationary.

Example

Let $M = D^2$, the 2-disk and let $N \subset M$ be a finite set of points. Then a motion $f: N \curvearrowright N$ is N -stationary if and only if $f_t(x) = x$ for all $x \in N$ and $t \in \mathbb{I}$. More generally this holds if N is a totally disconnected subspace of M , e.g. \mathbb{Q} in \mathbb{R} .

Congruence by set-stationary motions

Congruence by set-stationary motions

Lemma

For $N, N' \subset M$, denote by $\overset{m}{\sim}$ the relation

$$f: N \hookrightarrow N' \overset{m}{\sim} g: N \hookrightarrow N' \quad \text{if} \quad \bar{g} * f \in [\text{SetStat}_{\underline{M}}^N]_{\text{p}}$$

on $\text{Mt}_{\underline{M}}(N, N')$. This is an equivalence relation.

We call this motion-equivalence and denote by $[f: N \hookrightarrow N']_{\text{m}}$ the motion-equivalence class of $f: N \hookrightarrow N'$.

Congruence by set-stationary motions

Lemma

For $N, N' \subset M$, denote by $\overset{m}{\sim}$ the relation

$$f: N \curvearrowright N' \overset{m}{\sim} g: N \curvearrowright N' \quad \text{if} \quad \bar{g} * f \in [\text{SetStat}_{\underline{M}}^N]_p$$

on $\text{Mt}_{\underline{M}}(N, N')$. This is an equivalence relation.

We call this motion-equivalence and denote by $[f: N \curvearrowright N']_m$ the motion-equivalence class of $f: N \curvearrowright N'$.

Idea of proof

Quotient first by path-homotopy. Then classes which intersect $\text{SetStat}_{\underline{M}}^N(N, N)$ form a totally disconnected normal subgroupoid. Can be proved in general that for any totally disconnected, normal subgroupoid \mathcal{H} of a groupoid \mathcal{G} there is a congruence given by the relation $g_1 \sim g_2$ if $g_2^{-1} *_{\mathcal{G}} g_1 \in \mathcal{H}$. This leads to an equivalent relation to the given relation.

Motion groupoid

Theorem

Let $\underline{M} = (M, A)$ where M is a manifold and $A \subset M$ a subset. There is a groupoid

$$\text{Mot}_{\underline{M}} = (\mathcal{P}M, \text{Mt}_{\underline{M}}(N, N') / \overset{m}{\sim}, *, [\text{Id}_M]_m, [f]_m \mapsto [\bar{f}]_m)$$

where

- (I) objects are subsets of M ;
- (II) morphisms between subsets N, N' are motion-equivalence classes $[f: N \curvearrowright N']_m$ of motions;
- (III) composition of morphisms is given by

$$[g: N' \curvearrowright N'']_m * [f: N \curvearrowright N']_m = [g * f: N \curvearrowright N'']_m.$$

- (IV) the identity at each object N is the motion-equivalence class of $\text{Id}_M: N \curvearrowright N$, $(\text{Id}_M)_t(m) = m$ for all $m \in M$;
- (V) the inverse for each morphism $[f: N \curvearrowright N']_m$ is the motion-equivalence class of $\bar{f}: N' \curvearrowright N$ where $\bar{f}_t = f_{(1-t)} \circ f_1^{-1}$. □

Proposition

Let $\underline{M} = (M, A)$ where M is a manifold and $A \subset M$ a subset, then

$$\text{Mot}_{\underline{M}} = (\mathcal{P}M, \text{Mt}_{\underline{M}}(N, N') / \overset{m}{\sim}, \cdot, [\text{Id}_M]_m, [f]_m \mapsto [f^{-1}]_m).$$

Proof

It is sufficient to observe that motions which are path equivalent are motion equivalent. Let g, f be flows satisfying $f \overset{p}{\sim} g$, then $\bar{g} * f \overset{p}{\sim} g^{-1} \cdot f \overset{p}{\sim} g^{-1} \cdot g$, using that $\bar{g} \overset{p}{\sim} g^{-1}$, and $g * f \overset{p}{\sim} g \cdot f$. Then for all $t \in \mathbb{I}$, $(g^{-1} \cdot g)_t(N) = N$, hence it is stationary.

Suppose $N \subset \mathbb{I} \setminus \{0, 1\}$ is a compact subset with a finite number of connected components i.e. N is a union of points and closed intervals.

Suppose $N \subset \mathbb{I} \setminus \{0, 1\}$ is a compact subset with a finite number of connected components i.e. N is a union of points and closed intervals.

We can assign a word in $\{a, b\}$ to N by representing each point in N by a and each interval by b , ordered in the obvious way using the natural ordering on \mathbb{I} .

Suppose $N \subset \mathbb{I} \setminus \{0, 1\}$ is a compact subset with a finite number of connected components i.e. N is a union of points and closed intervals.

We can assign a word in $\{a, b\}$ to N by representing each point in N by a and each interval by b , ordered in the obvious way using the natural ordering on \mathbb{I} .

Let $N' \subset \mathbb{I} \setminus \{0, 1\}$ be another subset defined in the same way. If the word assigned to N and N' is the same, $|\text{Mot}_{\mathbb{I}}(N, N')| = 1$. Otherwise $\text{Mot}_{\mathbb{I}}(N, N') = \emptyset$.

Suppose $N \subset \mathbb{I} \setminus \{0, 1\}$ is a compact subset with a finite number of connected components i.e. N is a union of points and closed intervals.

We can assign a word in $\{a, b\}$ to N by representing each point in N by a and each interval by b , ordered in the obvious way using the natural ordering on \mathbb{I} .

Let $N' \subset \mathbb{I} \setminus \{0, 1\}$ be another subset defined in the same way. If the word assigned to N and N' is the same, $|\text{Mot}_{\mathbb{I}}(N, N')| = 1$. Otherwise $\text{Mot}_{\mathbb{I}}(N, N') = \emptyset$.

Let $N = \mathbb{I} \cap \mathbb{Q}$, then $\text{Mot}_{\mathbb{I}}(N, N)$ is uncountably infinite.

Braid groups and loop braid groups

Theorem (T., Faria Martins, Martin)

Let n be a positive integer. Consider $M = D^2$. Given any finite subset K , with n elements, in the interior of D^2 , then $\text{Mot}_{D^2}(K, K)$ is isomorphic to the braid group in n strands (as in 'Theory of Braids', Artin). In particular the image of the class of a motion which moves points as below is an elementary braid on two strands.

Also if $\underline{D^3} = (D^3, \partial D^3)$ and $L \subset D^3$ is an unlink in the interior with n components, then $\text{Mot}_{\underline{D^3}}(L, L)$ is isomorphic to the extended loop braid group (as in 'A journey through loop braid groups', Damiani).

Relating motion groupoids

Lemma

Let (M, A) and (M', A') be pairs such that there exists a homeomorphism $\psi: M \rightarrow M'$ satisfying $\psi(A) = A'$. Then there is an isomorphism of categories

$$\Psi: \text{Mot}_M \rightarrow \text{Mot}_{M'}$$

defined as follows. On objects $N \subset M$, $\Psi(N) = \psi(N)$. For a motion $f: N \curvearrowright N'$ in M , let $(\psi \circ f \circ \psi^{-1})_t = \psi \circ f_t \circ \psi^{-1}$. Then Ψ sends the equivalence class $[f: N \curvearrowright N']_m$ to the equivalence class $[\psi \circ f \circ \psi^{-1}: \psi(N) \rightarrow \psi(N')]_m$.

Proposition

For any pair (M, A) and subset $N \subseteq M$ there is an involutive endofunctor on $\text{Mot}_{\underline{M}}$ defined by

$$\begin{aligned}\text{Mot}_{\underline{M}}(N, N) &\cong \text{Mot}_{\underline{M}}(M \setminus N, M \setminus N), \\ f: N \curvearrowright N' &\mapsto f: M \setminus N \curvearrowright M \setminus N' .\end{aligned}$$

Proposition

For any pair (M, A) and subset $N \subseteq M$ there is an involutive endofunctor on $\text{Mot}_{\underline{M}}$ defined by

$$\begin{aligned}\text{Mot}_{\underline{M}}(N, N) &\cong \text{Mot}_{\underline{M}}(M \setminus N, M \setminus N), \\ f: N \curvearrowright N' &\mapsto f: M \setminus N \curvearrowright M \setminus N'.\end{aligned}$$

Notice that generally these automorphism groups are not connected *in* the motion groupoid - this would imply N homeomorphic to $M \setminus N$.

Alternative equivalence relations on the motion groupoid

Worldlines of motions

Definition

The worldline of a motion $f: N \curvearrowright N'$ in a manifold M is

$$\mathbf{W}(f: N \curvearrowright N') := \bigcup_{t \in [0,1]} f_t(N) \times \{t\} \subseteq M \times \mathbb{I}.$$

Definition

The worldline of a motion $f: N \curvearrowright N'$ in a manifold M is

$$\mathbf{W}(f: N \curvearrowright N') := \bigcup_{t \in [0,1]} f_t(N) \times \{t\} \subseteq M \times \mathbb{I}.$$

Proposition

Let $f, g: N \curvearrowright N'$ be motions with the same worldline, so we have

$$\mathbf{W}(f: N \curvearrowright N') = \mathbf{W}(g: N \curvearrowright N').$$

Then $f: N \curvearrowright N'$ and $g: N \curvearrowright N'$ are motion equivalent.

Definition

The worldline of a motion $f: N \curvearrowright N'$ in a manifold M is

$$\mathbf{W}(f: N \curvearrowright N') := \bigcup_{t \in [0,1]} f_t(N) \times \{t\} \subseteq M \times \mathbb{I}.$$

Proposition

Let $f, g: N \curvearrowright N'$ be motions with the same worldline, so we have

$$\mathbf{W}(f: N \curvearrowright N') = \mathbf{W}(g: N \curvearrowright N').$$

Then $f: N \curvearrowright N'$ and $g: N \curvearrowright N'$ are motion equivalent.

Proof

For all $t \in \mathbb{I}$, $(g^{-1} \cdot f)_t(N) = g_t^{-1} \circ f_t(N) = N$. Thus $g^{-1} \cdot f$ is N -stationary, and hence $\bar{g} * f$ path-homotopic to a stationary motion.

Worldlines of motions

Theorem (T., Faria Martins, Martin)

Let $\underline{M} = (M, A)$ where M is a manifold and $A \subset M$ a subset. Two motions $f, f': N \curvearrowright N'$ in $\text{Mt}_{\underline{M}}$ are motion equivalent if, and only if, their worldlines are level preserving ambient isotopic, relative to $(M \times (\{0, 1\})) \cup (A \times \mathbb{I})$, pointwise.

Groupoids of self homeomorphisms

Let M be a manifold and $A \subseteq M$ a subset.

Lemma

There is a (left) group action

$$\begin{aligned}\sigma^A: \mathbf{Top}_A^h(M, M) \times \mathcal{P}M &\rightarrow \mathcal{P}M \\ (f, N) &\mapsto f(N).\end{aligned}$$

Groupoids of self homeomorphisms

Let M be a manifold and $A \subseteq M$ a subset.

Proposition

There is an action groupoid Homeo_M with objects $\mathcal{P}M$. Explicitly the morphisms in $\text{Homeo}_M(N, N')$ are triples $(f, N, f(N))$ where

- $f: M \rightarrow M$ is a homeomorphism,
- $f(N) = N'$,
- f fixes A pointwise.

Groupoids of self homeomorphisms

Let M be a manifold and $A \subseteq M$ a subset.

Proposition

There is an action groupoid Homeo_M with objects $\mathcal{P}M$. Explicitly the morphisms in $\text{Homeo}_M(N, N')$ are triples $(f, N, f(N))$ where

- $f: M \rightarrow M$ is a homeomorphism,
- $f(N) = N'$,
- f fixes A pointwise.

We will denote triples $(f, N, f(N)) \in \text{Homeo}_M(N, N')$ as $f: N \rightsquigarrow N'$.

Identity: $\text{id}_M: N \rightsquigarrow N$ Inverse: $f: N \rightsquigarrow N' \mapsto f^{-1}: N' \rightsquigarrow N$.

Groupoids of self homeomorphisms

Let M be a manifold and $A \subseteq M$ a subset.

Proposition

There is an action groupoid $\text{Homeo}_{\underline{M}}$ with objects $\mathcal{P}M$. Explicitly the morphisms in $\text{Homeo}_{\underline{M}}(N, N')$ are triples $(f, N, f(N))$ where

- $f: M \rightarrow M$ is a homeomorphism,
- $f(N) = N'$,
- f fixes A pointwise.

We will denote triples $(f, N, f(N)) \in \text{Homeo}_{\underline{M}}(N, N')$ as $f: N \rightsquigarrow N'$.

Identity: $\text{id}_M: N \rightsquigarrow N$ Inverse: $f: N \rightsquigarrow N' \mapsto f^{-1}: N' \rightsquigarrow N$.

We will also sometimes consider $\text{Homeo}_{\underline{M}}(N, N')$ as the projection to the first element of the triple. Then can equip morphism sets with a topology and

$\mathbf{TOP}_A^h(M, M) = \text{Homeo}_{\underline{M}}(\emptyset, \emptyset) = \text{Homeo}_{\underline{M}}(M, M)$ and every

$\text{Homeo}_{\underline{M}}(N, N') \subseteq \mathbf{TOP}_A^h(M, M)$. Notice each self-homeomorphism f of M will belong to many such $\text{Homeo}_{\underline{M}}(N, N')$.

Relative path-equivalence

Definition

Fix a pair (M, A) . Define a relation on $\text{Mt}_M(N, N')$ as follows. Let $f: N \curvearrowright N' \stackrel{r_P}{\sim} g: N \curvearrowright N'$ if the motions $f: N \curvearrowright N'$ and $g: N \curvearrowright N'$ are relative path-homotopic. This means there exists a continuous map

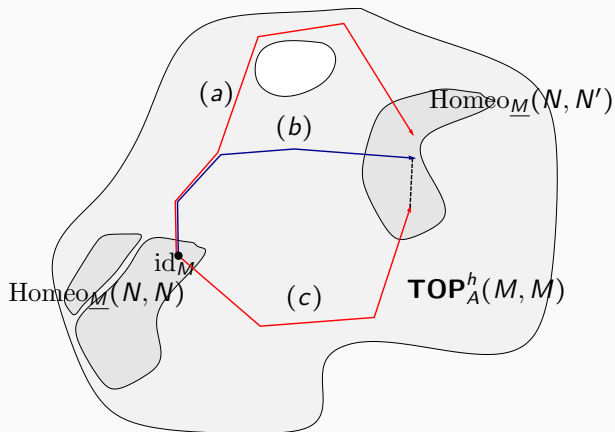

$$H: \mathbb{I} \times \mathbb{I} \rightarrow \mathbf{TOP}_A^h(M, M)$$

such that

- for any fixed $s \in \mathbb{I}$, $t \mapsto H(t, s)$ is a motion from N to N' ,
- for all $t \in \mathbb{I}$, $H(t, 0) = f_t$, and
- for all $t \in \mathbb{I}$, $H(t, 1) = g_t$.

We call such a homotopy a relative path-homotopy.

Relative path-equivalence

Relative path-equivalence

Theorem (T. , Faria Martins, Martin)

For a pair $\underline{M} = (M, A)$ and a motion $f: N \rightsquigarrow N'$ in \underline{M} we have

$$[f: N \rightsquigarrow N']_{rp} = [f: N \rightsquigarrow N']_m.$$

Key ingredients of proof

Direct construction of appropriate homotopies. Uses normality of stationary motions.

Relative path-equivalence

Theorem (T. , Faria Martins, Martin)

For a pair $\underline{M} = (M, A)$ and a motion $f: N \rightsquigarrow N'$ in \underline{M} we have

$$[f: N \rightsquigarrow N']_{\text{rp}} = [f: N \rightsquigarrow N']_{\text{m}}.$$

Key ingredients of proof

Direct construction of appropriate homotopies. Uses normality of stationary motions.

Relative path equivalence is precisely the equivalence relation in the relative fundamental group, hence

$$\text{Mot}_{\underline{M}}(N, N) = \pi_1(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{Homeo}_{\underline{M}}(N, N), \text{id}_M)$$

We will need this later!

Mapping class groupoids

Mapping class groupoid

Recall that for a pair $\underline{M} = (M, A)$ and for subsets $N, N' \subset M$, morphisms in $\text{Homeo}_{\underline{M}}(N, N')$ are triples denoted $f: N \rightsquigarrow N'$ where $f \in \mathbf{Top}_A^h(M, M)$ and $f(N) = N'$. We also think of the elements of $\text{Homeo}_{\underline{M}}(N, N')$ as the projection to the first coordinate of each triple i.e. $f \in \mathbf{Top}_A^h(M, M)$ such that $f(N) = N'$.

Mapping class groupoid

Recall that for a pair $\underline{M} = (M, A)$ and for subsets $N, N' \subset M$, morphisms in $\text{Homeo}_{\underline{M}}(N, N')$ are triples denoted $f: N \rightsquigarrow N'$ where $f \in \mathbf{Top}_A^h(M, M)$ and $f(N) = N'$. We also think of the elements of $\text{Homeo}_{\underline{M}}(N, N')$ as the projection to the first coordinate of each triple i.e. $f \in \mathbf{Top}_A^h(M, M)$ such that $f(N) = N'$.

Definition

Let $N, N' \subset M$. For any $f: N \rightsquigarrow N'$ and $g: N \rightsquigarrow N'$ in $\text{Homeo}_{\underline{M}}(N, N')$, $f: N \rightsquigarrow N'$ is said to be isotopic to $g: N \rightsquigarrow N'$, denoted by $\overset{i}{\sim}$, if there exists a continuous map

$$H: M \times \mathbb{I} \rightarrow M$$

such that

- for all fixed $s \in \mathbb{I}$, the map $m \mapsto H(m, s)$ is in $\text{Homeo}_{\underline{M}}(N, N')$,
- for all $m \in M$, $H(m, 0) = f(m)$, and
- for all $m \in M$, $H(m, 1) = g(m)$.

We call such a map an **isotopy** from $f: N \rightsquigarrow N'$ to $g: N \rightsquigarrow N'$.

Lemma

The family of relations $(\text{Homeo}_{\underline{M}}(N, N'), \overset{i}{\sim})$ for all pairs $N, N' \subseteq M$ are a congruence on $\text{Homeo}_{\underline{M}}$.

Theorem (T., Faria Martins, Martin)

Let $\underline{M} = (M, A)$ be a manifold submanifold pair. There is a groupoid

$$\text{MCG}_{\underline{M}} = (\mathcal{P}M, \text{Homeo}_{\underline{M}}(N, N') / \overset{i}{\sim}, \circ, [\text{id}_M], [f] \mapsto [f^{-1}]).$$

We call this the mapping class groupoid of M .

Using bijection

$$\Phi: \mathbf{Top}(\mathbb{I}, \mathbf{TOP}(M, M)) \rightarrow \mathbf{Top}(M \times \mathbb{I}, M),$$

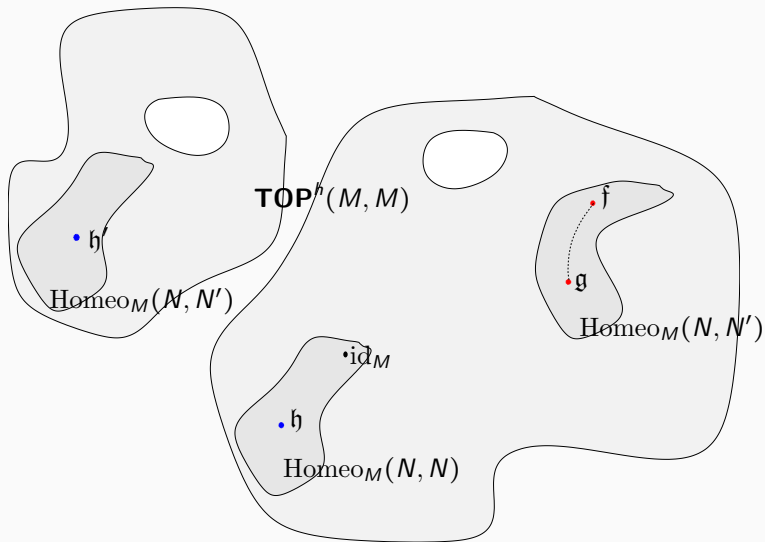

a continuous map $M \times \mathbb{I} \rightarrow M$ which is an isotopy corresponds to a path $\mathbb{I} \rightarrow \mathbf{Homeo}_M(N, N')$ from f to g . Hence

Lemma

Let M be a manifold. We have that as sets

$$\mathbf{MCG}_{\underline{M}}(N, N') = \pi_0(\mathbf{Homeo}_{\underline{M}}(N, N')).$$

Mapping class groupoids

Example

If $\underline{S^1} = (S^1, \emptyset)$, we have

$$\text{MCG}_{\underline{S^1}}(\emptyset, \emptyset) = \mathbb{Z}/2\mathbb{Z}.$$

$\mathbf{TOP}^h(S^1, S^1)$ has two path-components, containing respectively the orientation preserving and the orientation reversing homeomorphisms from S^1 to itself. Each is homotopic to S^1 (Hamstrom). Therefore the homomorphism $\pi_0(\text{Homeo}_{\underline{S^1}}(\emptyset, \emptyset)) \rightarrow \{\pm 1\} \cong \mathbb{Z}/2\mathbb{Z}$ induced by the degree homomorphism $\text{deg}: \mathbf{Top}^h(S^1, S^1) = \text{Homeo}_{\underline{S^1}}(\emptyset, \emptyset) \rightarrow \{\pm 1\}$ is an isomorphism.

Example

Proposition

Let $\underline{D^2} = (D^2, \partial D^2)$. The morphism group $\text{MCG}_{\underline{D^2}}(\emptyset, \emptyset)$ is trivial.

Example

Proposition

Let $\underline{D^2} = (D^2, \partial D^2)$. The morphism group $\text{MCG}_{\underline{D^2}}(\emptyset, \emptyset)$ is trivial.

Proof

(This follows from the Alexander trick.) Suppose we have $f: \emptyset \rightsquigarrow \emptyset$ in $\underline{D^2}$. Define

$$f_t(x) = \begin{cases} t f(x/t) & 0 \leq |x| \leq t, \\ x & t \leq |x| \leq 1. \end{cases}$$

Notice that $f_0 = \text{id}_{D^2}$ and $f_1 = f$ and each f_t is continuous. Moreover:

$$\begin{aligned} H: D^2 \times \mathbb{I} &\rightarrow D^2, \\ (x, t) &\mapsto f_t(x) \end{aligned}$$

is a continuous map. So we have constructed an isotopy from any boundary preserving self-homeomorphism of D^2 to id_{D^2} .

**Functor from the motion
groupoid to the mapping class
groupoid**

Theorem (T., Faria Martins, Martin)

Let $\underline{M} = (M, A)$. There is a functor

$$F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$$

which is the identity on objects and on morphisms we have

$$F([f: N \curvearrowright N']_m) = [f_1: N \curvearrowright N']_j.$$

Functor $F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$

Lemma

The functor

$$F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$$

is full if and only if $\pi_0(\mathbf{TOP}_A^h(M, M), \text{id}_M)$ is trivial.

(Hatcher) Let X be a space, $Y \subset X$ a subspace and $x_0 \in Y$ a basepoint. There is a long exact sequence:

$$\begin{aligned} \dots \rightarrow \pi_n(Y, \{x_0\}) \xrightarrow{i_*^n} \pi_n(X, \{x_0\}) \xrightarrow{j_*^n} \pi_n(X, Y, \{x_0\}) \\ \xrightarrow{\partial^n} \pi_{n-1}(Y, \{x_0\}) \xrightarrow{i_*^{n-1}} \dots \xrightarrow{i_*^0} \pi_0(X, \{x_0\}). \end{aligned}$$

(Hatcher) Let X be a space, $Y \subset X$ a subspace and $x_0 \in Y$ a basepoint. There is a long exact sequence:

$$\begin{aligned} \dots \rightarrow \pi_n(Y, \{x_0\}) \xrightarrow{i_*^n} \pi_n(X, \{x_0\}) \xrightarrow{j_*^n} \pi_n(X, Y, \{x_0\}) \\ \xrightarrow{\partial^n} \pi_{n-1}(Y, \{x_0\}) \xrightarrow{i_*^{n-1}} \dots \xrightarrow{i_*^0} \pi_0(X, \{x_0\}). \end{aligned}$$

Maps i and j are inclusions. Maps ∂ are restrictions to single face, in particular

$$\begin{aligned} \partial^1: \pi_1(X, A, \{x_0\}) &\rightarrow \pi_0(A, \{x_0\}), \\ [\gamma]_{\mathbb{P}} &\mapsto [\gamma(1)]_{\mathbb{P}}. \end{aligned}$$

Functor $F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$

Recall $\text{Mot}_{\underline{M}}(N, N) = \pi_1(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{Homeo}_{\underline{M}}(N, N), \text{id}_M)$ and $\text{MCG}_{\underline{M}}(N, N) = \pi_0(\text{Homeo}_{\underline{M}}(N, N), \text{id}_M)$.

Functor $F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$

Recall $\text{Mot}_{\underline{M}}(N, N) = \pi_1(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{Homeo}_{\underline{M}}(N, N), \text{id}_M)$ and $\text{MCG}_{\underline{M}}(N, N) = \pi_0(\text{Homeo}_{\underline{M}}(N, N), \text{id}_M)$.

Lemma

Let $\underline{M} = (M, A)$ be a manifold, subset pair, and fix a subset $N \subset M$. Then we have a long exact sequence

$$\begin{aligned} \dots \rightarrow \pi_n(\text{Homeo}_{\underline{M}}(N, N), \text{id}_M) &\xrightarrow{i_*^n} \pi_n(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M) \xrightarrow{j_*^n} \\ \pi_n(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{Homeo}_{\underline{M}}(N, N), \text{id}_M) &\xrightarrow{\partial^n} \pi_{n-1}(\text{Homeo}_{\underline{M}}(N, N), \text{id}_M) \xrightarrow{i_*^{n-1}} \\ \dots \xrightarrow{\partial^2} \pi_1(\text{Homeo}_{\underline{M}}(N, N), \text{id}_M) &\xrightarrow{i_*^1} \pi_1(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M) \\ &\xrightarrow{j_*^1} \text{Mot}_{\underline{M}}(N, N) \xrightarrow{F} \text{MCG}_{\underline{M}}(N, N) \xrightarrow{i_*^0} \pi_0(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M) \end{aligned}$$

where all maps are group maps and F is the appropriate restriction of the functor $F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$.

Functor $F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$

Lemma

Suppose

- $\pi_1(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M)$ is trivial, and
- $\pi_0(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M)$ is trivial.

Then there is a group isomorphism

$$F: \text{Mot}_{\underline{M}}(N, N) \xrightarrow{\sim} \text{MCG}_{\underline{M}}(N, N).$$

Theorem (T., Faria Martins, Martin)

Let M be a manifold. If

- $\pi_1(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M)$ is trivial, and
- $\pi_0(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M)$ is trivial,

the functor

$$F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}},$$

is an isomorphism of categories.

Functor $F: \text{Mot}_{\underline{M}} \rightarrow \text{MCG}_{\underline{M}}$

Proof

Suppose $\pi_1(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M)$ and $\pi_0(\text{Homeo}_{\underline{M}}(\emptyset, \emptyset), \text{id}_M)$ are trivial.

Already proved F is full. We check F is faithful. Let $[f: N \curvearrowright N']_m$ and $[f': N \curvearrowright N']_m$ be in $\text{Mot}_{\underline{M}}(N, N')$. If $F([f: N \curvearrowright N']_m) = F([f': N \curvearrowright N']_m)$, then

$$\begin{aligned} [\text{id}_M: N \curvearrowright N]_j &= F([f': N \curvearrowright N']_m)^{-1} \circ F([f: N \curvearrowright N']_m) \\ &= F([f': N \curvearrowright N']_m^{-1} * [f: N \curvearrowright N']_m) \\ &= F([\bar{f}' * f: N \curvearrowright N]_m). \end{aligned}$$

By group isomorphism this is true if and only if

$$[\bar{f}' * f: N \curvearrowright N]_m = [\text{Id}_M: N \curvearrowright N]_m$$

which is equivalent to saying $\text{Id}_M * (\bar{f}' * f)$ is path-equivalent to a stationary motion, and hence that $\bar{f}' * f$ is path-equivalent to the stationary motion (since $\text{Id}_M * (\bar{f}' * f) \stackrel{p}{\sim} \bar{f}' * f$). So we have $[f: N \curvearrowright N']_m = [f': N \curvearrowright N']_m$.

Proposition

Let D^n be the n -disk, and $\underline{D}^n = (D^n, \partial D^n)$. Then we have an isomorphism

$$F: \text{Mot}_{\underline{D}^n} \rightarrow \text{MCG}_{\underline{D}^n}.$$

Proposition

Let D^n be the n -disk, and $\underline{D}^n = (D^n, \partial D^n)$. Then we have an isomorphism

$$F: \text{Mot}_{\underline{D}^n} \rightarrow \text{MCG}_{\underline{D}^n}.$$

Proposition

Let D^n be the n -disk, and $\underline{D}^n = (D^n, \partial D^n)$. Then we have an isomorphism

$$F: \text{Mot}_{\underline{D}^n} \rightarrow \text{MCG}_{\underline{D}^n}.$$

Idea of proof

We proved that $\text{MCG}_{\underline{D}^2}(\emptyset, \emptyset) = \pi_0(\text{Homeo}_{\underline{D}^2}(\emptyset, \emptyset), \text{id}_M)$ is trivial. Alexander trick gives same result for all n . Also $\text{Homeo}_{\underline{D}^n}(\emptyset, \emptyset)$ is contractible (Hamstrom).

Examples: $M = D^2$

Suppose we don't fix the boundary.

Examples: $M = D^2$

Suppose we don't fix the boundary. Let $P_2 \subset D^2$ be a subset consisting of two points equidistant from the centre of the disk. Let τ_π be the path in $\mathbf{TOP}^h(D^2, D^2)$ such that $\tau_{\pi t}$ is a πt rotation of the disk.

Examples: $M = D^2$

Suppose we don't fix the boundary. Let $P_2 \subset D^2$ be a subset consisting of two points equidistant from the centre of the disk. Let τ_π be the path in $\mathbf{TOP}^h(D^2, D^2)$ such that $\tau_{\pi t}$ is a πt rotation of the disk.

The motion $\tau_\pi: P_2 \curvearrowright P_2$ represents a non-trivial equivalence class in Mot_{D^2} , and its end point also represents a non trivial element of MCG_{D^2} . Now consider the motion $\tau_\pi * \tau_\pi: P_2 \curvearrowright P_2$.

Examples: $M = D^2$

In fact, the map $F: \text{Mot}_{D^2} \rightarrow \text{MCG}_{D^2}$ is neither full nor faithful. The space Homeo_{D^2} is homotopy equivalent to $S^1 \sqcup S^1$, where the first connected component corresponds to orientation preserving homeomorphisms and the second orientation reversing (Hamstrom). Hence we have that $\pi_1(\text{Homeo}_{D^2}(\emptyset, \emptyset), \text{id}_{D^2}) = \mathbb{Z}$ where the single generating element corresponds to the 2π rotation. And $\pi_0(\text{Homeo}_{D^2}(\emptyset, \emptyset), \text{id}_{D^2}) = \mathbb{Z}/2\mathbb{Z}$. So we have an exact sequence:

$$\dots \rightarrow \pi_1(\text{Homeo}_{D^2}(N, N), \text{id}_{D^2}) \xrightarrow{i_*^1} \mathbb{Z} \rightarrow \text{Mot}_{D^2}(N, N) \rightarrow \text{MCG}_{D^2}(N, N) \rightarrow \mathbb{Z}/2\mathbb{Z}.$$

Examples: $M = S^1$

Let $P \subset S^1$ be a subset containing a single point in S^1 . Similarly to the disk, there is a non-trivial morphism in $\text{Mot}_{\underline{S^1}}(P, P)$ represented by a 2π rotation of the circle.

Examples: $M = S^1$

Note that the connected component containing id_{S^1} of $\text{Homeo}_{S^1}(P, P)$ is contractible, (Hamstrom). In particular $\pi_1(\text{Homeo}_{S^1}(P, P), \text{id}_{S^1})$ is trivial. We also have that $S^1 \sqcup S^1$ is a strong deformation retract of $\text{Homeo}_{S^1}(\emptyset, \emptyset)$, with the first copy of S^1 corresponding to orientation preserving homeomorphisms and the second to orientation reversing. Hence the sequence becomes

$$\dots \rightarrow \{1\} \rightarrow \mathbb{Z} \rightarrow \text{Mot}_{S^1}(P, P) \rightarrow \text{MCG}_{S^1}(P, P) \rightarrow \mathbb{Z}/2\mathbb{Z}.$$

The exact sequence gives an injective map

$\mathbb{Z} \cong \pi_1(\text{Homeo}_{\underline{S^1}}(\emptyset, \emptyset), \text{id}_{S^1}) \rightarrow \text{Mot}_{S^1}(P, P)$, sending $n \in \mathbb{Z}$ to the equivalence class of the flow tracing a $2n\pi$ rotation of the circle S^1 . The space

$\text{Homeo}_{\underline{S^1}}(P, P)$ only has two connected components, consisting of orientations preserving and orientation reversing homeomorphisms of S^1 fixing P . Hence the exact sequence becomes:

$$\dots \rightarrow \{1\} \rightarrow \mathbb{Z} \xrightarrow{\cong} \text{Mot}_{S^1}(P, P) \xrightarrow{0} \text{MCG}_{S^1}(P, P) \xrightarrow{\cong} \mathbb{Z}/2\mathbb{Z}.$$

Motion groupoids

University of Bristol

The loop braid category L

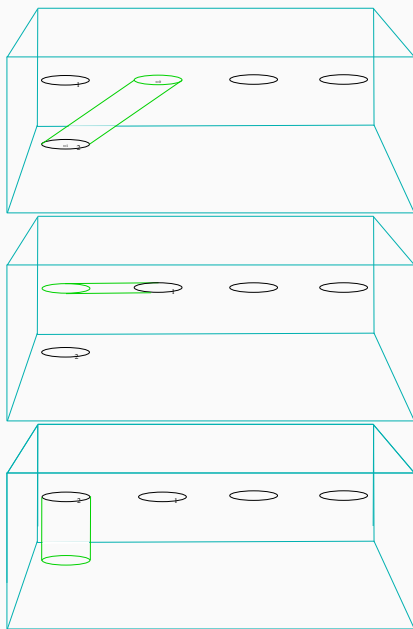

Objects in the loop braid category \mathbb{L}

For each $n \in \mathbb{N}$, n evenly spaced circles in a plane in $[0, 1]^3$.

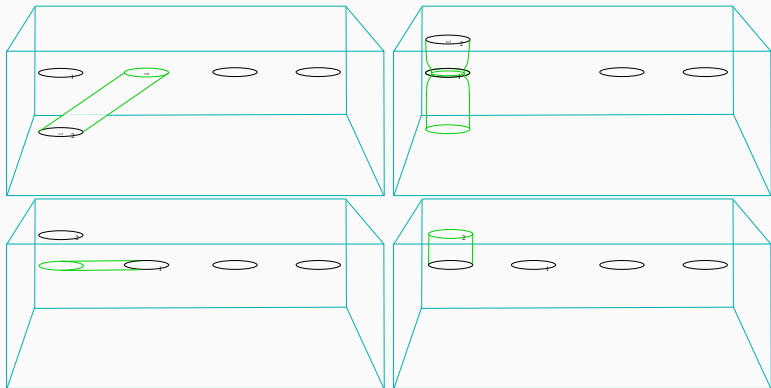

For example for $n = 4$:

Morphisms in L - equivalence class of the swap motion Q_i

Morphisms in L - equivalence class of the braid motion ζ_i

Composition in L

Category composition is given by performing one motion followed by the next.

Composition in L

Category composition is given by performing one motion followed by the next.

Composition in \mathbb{L}

Category composition is given by performing one motion followed by the next.

There is a function $\mathbb{I}^3 \sqcup \mathbb{I}^3 \rightarrow \mathbb{I}^3$ that takes the corresponding $I_n \sqcup I_m$ to I_{n+m} :

This extends to morphisms to give monoidal composition.

Combinatorial category L'

The category L' is the strict monoidal (diagonal) groupoid with object monoid the natural numbers, and two generating morphisms (and inverses) both in $L'(2, 2)$, call them σ and s , obeying

$$s^2 = 1 \otimes 1$$

where (as a morphism) 1 denotes the unit morphism in rank one;

$$s_1 s_2 s_1 = s_2 s_1 s_2 \tag{3}$$

where $s_1 = s \otimes 1$ and $s_2 = 1 \otimes s$,

$$\begin{aligned} \text{(I)} \quad \sigma_1 \sigma_2 \sigma_1 = \sigma_2 \sigma_1 \sigma_2, & \quad \text{(II)} \quad \sigma_1 \sigma_2 s_1 = s_2 \sigma_1 \sigma_2, & \quad \text{(III)} \quad \sigma_1 s_2 s_1 = s_2 s_1 \sigma_2. \end{aligned} \tag{4}$$

Combinatorial category L'

The category L' is the strict monoidal (diagonal) groupoid with object monoid the natural numbers, and two generating morphisms (and inverses) both in $L'(2, 2)$, call them σ and s , obeying

$$s^2 = 1 \otimes 1$$

where (as a morphism) 1 denotes the unit morphism in rank one;

$$s_1 s_2 s_1 = s_2 s_1 s_2 \tag{3}$$

where $s_1 = s \otimes 1$ and $s_2 = 1 \otimes s$,

$$\text{(I) } \sigma_1 \sigma_2 \sigma_1 = \sigma_2 \sigma_1 \sigma_2, \quad \text{(II) } \sigma_1 \sigma_2 s_1 = s_2 \sigma_1 \sigma_2, \quad \text{(III) } \sigma_1 s_2 s_1 = s_2 s_1 \sigma_2. \tag{4}$$

Proposition

The map on generators $s: 2 \rightarrow 2 \mapsto \varrho: 2 \rightarrow 2$ and $\sigma: 2 \rightarrow 2 \mapsto \varsigma: 2 \rightarrow 2$ is an isomorphism $L' \cong L$.

Monoidal functors

Definition

A monoidal loop braid representation is given by a monoidal functor

$$F: L \rightarrow \mathcal{C}$$

where \mathcal{C} is a monoidal category.

Match^N categories

Mat^N categories

Let Mat denote the category with objects $n \in \mathbb{N}$ and morphisms $f: i \rightarrow j$ are $j \times i$ matrices.

Mat^N categories

Let Mat denote the category with objects $n \in \mathbb{N}$ and morphisms $f: i \rightarrow j$ are $j \times i$ matrices.

Mat becomes a monoidal category with the Kronecker product of matrices, and object monoid (\mathbb{N}, \times) .

Mat^N categories

Let Mat denote the category with objects $n \in \mathbb{N}$ and morphisms $f: i \rightarrow j$ are $j \times i$ matrices.

Mat becomes a monoidal category with the Kronecker product of matrices, and object monoid (\mathbb{N}, \times) .

Let $\text{Mat}^N \subset \text{Mat}$ denote the full subcategory with object monoid generated by N , i.e. matrices with dimensions N, N^2, N^3, \dots

Mat^N categories

Let Mat denote the category with objects $n \in \mathbb{N}$ and morphisms $f: i \rightarrow j$ are $j \times i$ matrices.

Mat becomes a monoidal category with the Kronecker product of matrices, and object monoid (\mathbb{N}, \times) .

Let $\text{Mat}^N \subset \text{Mat}$ denote the full subcategory with object monoid generated by N , i.e. matrices with dimensions N, N^2, N^3, \dots

Label the rows/columns of a matrix in $\text{Mat}^N(N, N)$ by $|1\rangle, |2\rangle, \dots, |N\rangle$

Mat^N categories

Let Mat denote the category with objects $n \in \mathbb{N}$ and morphisms $f: i \rightarrow j$ are $j \times i$ matrices.

Mat becomes a monoidal category with the Kronecker product of matrices, and object monoid (\mathbb{N}, \times) .

Let $\text{Mat}^N \subset \text{Mat}$ denote the full subcategory with object monoid generated by N , i.e. matrices with dimensions N, N^2, N^3, \dots

Label the rows/columns of a matrix in $\text{Mat}^N(N, N)$ by $|1\rangle, |2\rangle, \dots, |N\rangle$ and then the rows/columns in matrices in $\text{Mat}^N(N \otimes N, N \otimes N) = \text{Mat}^N(N^2, N^2)$ are labelled by pairs $|ij\rangle$ with $i, j \in \{1, \dots, N\}$, and in $\text{Mat}^N(N^3, N^3)$ $|ijk\rangle \dots$

Mat^N categories

Let Mat denote the category with objects $n \in \mathbb{N}$ and morphisms $f: i \rightarrow j$ are $j \times i$ matrices.

Mat becomes a monoidal category with the Kronecker product of matrices, and object monoid (\mathbb{N}, \times) .

Let $\text{Mat}^N \subset \text{Mat}$ denote the full subcategory with object monoid generated by N , i.e. matrices with dimensions N, N^2, N^3, \dots

Label the rows/columns of a matrix in $\text{Mat}^N(N, N)$ by $|1\rangle, |2\rangle, \dots, |N\rangle$ and then the rows/columns in matrices in $\text{Mat}^N(N \otimes N, N \otimes N) = \text{Mat}^N(N^2, N^2)$ are labelled by pairs $|ij\rangle$ with $i, j \in \{1, \dots, N\}$, and in $\text{Mat}^N(N^3, N^3)$ $|ijk\rangle \dots$

Can relabel object N by 1, N^2 by 2 etc., so set of objects is \mathbb{N} , and we have $n \otimes m = n + m$.

Mat^N categories

Let Mat denote the category with objects $n \in \mathbb{N}$ and morphisms $f: i \rightarrow j$ are $j \times i$ matrices.

Mat becomes a monoidal category with the Kronecker product of matrices, and object monoid (\mathbb{N}, \times) .

Let $\text{Mat}^N \subset \text{Mat}$ denote the full subcategory with object monoid generated by N , i.e. matrices with dimensions N, N^2, N^3, \dots

Label the rows/columns of a matrix in $\text{Mat}^N(N, N)$ by $|1\rangle, |2\rangle, \dots, |N\rangle$ and then the rows/columns in matrices in $\text{Mat}^N(N \otimes N, N \otimes N) = \text{Mat}^N(N^2, N^2)$ are labelled by pairs $|ij\rangle$ with $i, j \in \{1, \dots, N\}$, and in $\text{Mat}^N(N^3, N^3)$ $|ijk\rangle \dots$

Can relabel object N by 1, N^2 by 2 etc., so set of objects is \mathbb{N} , and we have $n \otimes m = n + m$. So Mat^N is a monoidal category with object monoid $(\mathbb{N}^{\mathbb{N}}, \times) \cong (\mathbb{N}, +)$.

Match^N categories

.

Match^N categories

Matrix in $\text{Mat}^5(4,4)$ has rows and columns labelled by $|ijkl\rangle$ where $i, j, k, l \in \{1, 2, 3, 4, 5\}$.

Match^N categories

Matrix in $\text{Mat}^5(4,4)$ has rows and columns labelled by $|ijkl\rangle$ where $i, j, k, l \in \{1, 2, 3, 4, 5\}$.

Definition

A matrix $M \in \text{Mat}^N(n, n)$ is **charge conserving** if $M_{w,w'} = \langle w|M|w'\rangle \neq 0$ implies that w is a perm of w' . That is $w = \sigma w'$ for some $\sigma \in \Sigma_n$, where symmetric group Σ_n acts by place permutation.

Example in $\text{Mat}^2(2,2)$

$$\begin{array}{c} |11\rangle \\ |21\rangle \\ |12\rangle \\ |22\rangle \end{array} \begin{pmatrix} |11\rangle & |21\rangle & |12\rangle & |22\rangle \\ a_1 & 0 & 0 & 0 \\ 0 & a & b & 0 \\ 0 & c & d & 0 \\ 0 & 0 & 0 & a_2 \end{pmatrix}$$

Match^N categories

Matrix in $\text{Mat}^5(4,4)$ has rows and columns labelled by $|ijkl\rangle$ where $i, j, k, l \in \{1, 2, 3, 4, 5\}$.

Definition

A matrix $M \in \text{Mat}^N(n, n)$ is **charge conserving** if $M_{w,w'} = \langle w|M|w'\rangle \neq 0$ implies that w is a perm of w' . That is $w = \sigma w'$ for some $\sigma \in \Sigma_n$, where symmetric group Σ_n acts by place permutation.

Example in $\text{Mat}^2(2,2)$

$$\begin{array}{c} |11\rangle \\ |21\rangle \\ |12\rangle \\ |22\rangle \end{array} \begin{pmatrix} |11\rangle & |21\rangle & |12\rangle & |22\rangle \\ a_1 & 0 & 0 & 0 \\ 0 & a & b & 0 \\ 0 & c & d & 0 \\ 0 & 0 & 0 & a_2 \end{pmatrix}$$

Charge conserving matrices form a monoidal subcategory of Mat^N - denote this Match^N .

Charge conserving loop braid representations

Definition

A charge conserving monoidal loop braid representation is given by a strict monoidal functor

$$F: L \rightarrow \text{Match}^N$$

such that $F(1) = 1$.

Charge conserving loop braid representations

Definition

A charge conserving monoidal loop braid representation is given by a strict monoidal functor

$$F: L \rightarrow \text{Match}^N$$

such that $F(1) = 1$.

Since $L \cong L'$, such functors are given by giving the images of the generators of L' :

$$F_* = (F(s), F(\sigma)) = (S, R)$$

such that $S, R \in \text{Match}^N(2, 2)$, and

$$S^2 = 1,$$

$$S_1 S_2 S_1 = S_2 S_1 S_2$$

where $S_1 = S \otimes 1$ and $S_2 = 1 \otimes S$ (where \otimes is Kronecker product),

$$(I) R_1 R_2 R_1 = R_2 R_1 R_2, \quad (II) R_1 R_2 S_1 = S_2 R_1 R_2, \quad (III) R_1 S_2 S_1 = S_2 S_1 R_2.$$

Signed multisets

Let J_N^\pm be the set of signed multisets of compositions with at most two parts, of total rank N .

Example

$$J_2^\pm = \{(\square^2,), (\square\square^1,), (\square^1,), (\square^1, \square^1), (, \square^2), (, \square\square^1), (, \square^1, \square^1)\}$$

Example

$$\lambda = \left(\begin{array}{c} \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \\ \square \end{array}, \begin{array}{c} \square \\ \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \\ \square \end{array} \quad \begin{array}{c} \square \\ \square \\ \square \\ \square \end{array} \right)$$

is in J_{26}^\pm .

Main theorem

Theorem (Martin, Rowell, T.)

The set of all varieties of charge-conserving loop braid representations from the loop braid category L to the category Match^N of charge conserving matrices

$$F : L \rightarrow \text{Match}^N$$

may be indexed by J_N^\pm .
